

TASK:

**Create a simple e-commerce platform which includes list of products and a cart.**

Page divides into two sections - cart and products. If there is no products added to cart, cart section is hidden (with possibility to roll out). After rolling out there should be a message: 'Your cart is empty'.

Your shop should consist of at least 8 products (clothes, food or furniture - their kind is up to you). Each product must have: picture, name, price and 'Add to cart' button. Above the list of products place the sorting list (by price and by name). Products have to rearrange, depending on chosen sorting option.

Clicking "Add to cart" makes the cart roll out with the list of added products. All products on the list need to have a thumbnail image. Each product in the cart can be removed and its quantity can be changed by adding or reducing items. The amount of all added products has to be displayed in the cart.

Last but not the least. Remember about the **responsiveness!**

Please share your project with us via public repository. Using demo web server will be **appreciated**.

You can get **additional points** by making sure that products in the cart will stay there after refreshing the page.

Use CSS (SCSS) without framework CSS, BEM CSS. Also use JS (feel free to choose framework - Angular, React, Vue or vanilla js).

Yep, that's all. Good luck!

In a case of any additional questions we are here for you.
